

Lossless phase-interleaved folding on real EEG

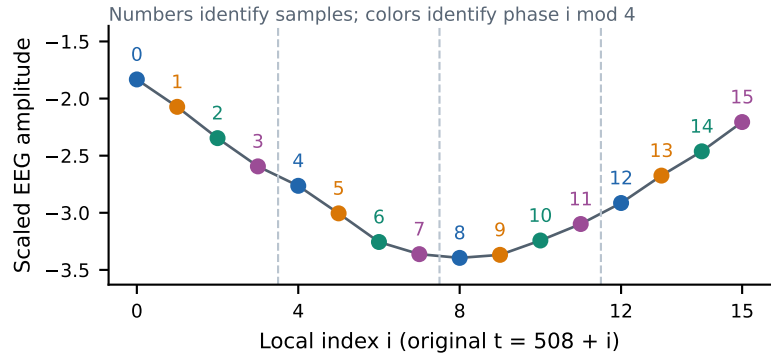

(a) Real EEG: $16 \times 1,000$

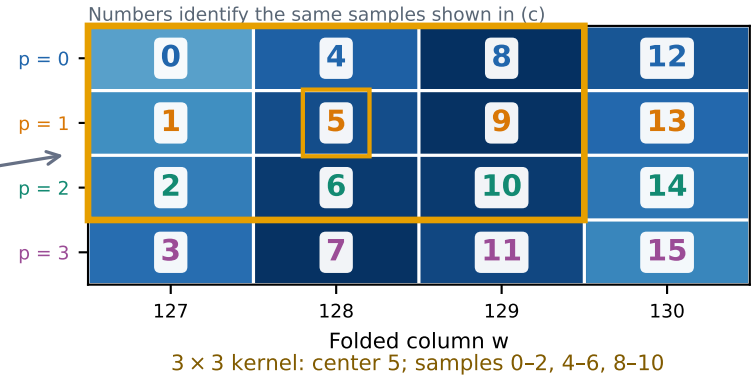

(b) Same data folded: 64×250

(c) Zoom: C4-P4, 16 real samples

(d) Folded samples and a 3×3 kernel

Each column groups four consecutive samples; each row follows one phase: $I[cP + p, w] = X[c, wP + p]$.
