

One EEG Signal, Two Viewpoints: Side View for Humans, Top View for CNNs

A. Synthetic spike-slow-wave: side view

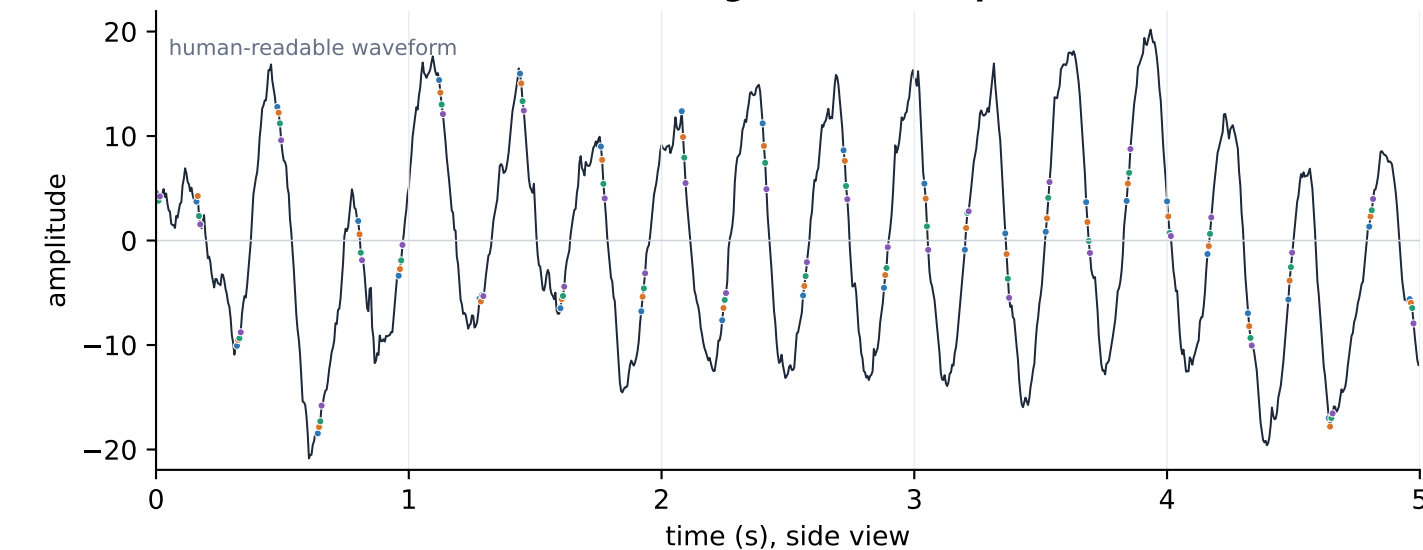

B. Same samples: CNN top view after P=4

Folding is a change of viewpoint and adjacency: no samples are added, removed, or interpolated.

$$I[cP + p, w] = X[c, wP + p] \quad | \quad \text{vertical phase neighbors are adjacent to the CNN}$$

C. Real CHB-MIT F7-T7 seizure segment (5 s crop): side view

D. Same samples: CNN top view after P=4
